

Features

1. Game (Prompt and response w/ timer)

The name of this feature will be **HOT WAR**. This feature will allow the user to learn interactively. We will have preloaded/ pre-designed data sets that users will be able to choose from. And once the selection is made, the game will start in which a question labeled meteor will be falling from the sky, and the user's job will be to answer the question correctly to destroy the meteor in time before it hits the ground (defeat). The preloaded datasets will include general trivia, basketball trivia, valorant map trivia, data mining questions, etc. Our target user is someone looking for a game to play while still learning or someone who wants to learn, but wants a more entertaining method. The users will interact with this feature by being prompted by the questions, and then typing their answers in. This brings both that dopamine from playing a game, and the ability to learn at the same time which is the unique experience we want to give.

2. Creating your own study sets

The name of this feature will be **PREPARE YOUR ARSENAL**. This feature will allow the user to create its own study sets of anything they like, free of cost. We will provide a template for the user, and the user will be able to customize it however the user likes. And after creating their own dataset, they can use that dataset for the game. The target user is someone who likes the original feature, but the given datasets don't quite cover the niche that they would like to study. Users will be able to interact by adding their own prompts with answers that they design. They will also be able to attribute alternative answers to the question if it has multiple answers, or allow answers with specific words in it if it's a more vague answer. The system will allow these questions and answers to be created in a robust manner. This will allow the customer to study the topics that they desire with questions that they personally design.

3. Sharing study sets

The name of this feature will be **COUNTER INTELLIGENCE**. This feature will allow the users to share their study sets with other users. The user can use a study set published by another user, as well as have the opportunity to publish the datasets that they have made themselves. Download and publish as many study sets as the user wants, free of cost. The target users are either informed people who want to share their knowledge base with other people in their field, or people new to a certain field who want to learn more in a fun and engaging manner, but don't have the baseline knowledge necessary to make their own study set, so they are able to use a study set created by someone else. Users will be able to interact with both the uploading end of their personal study sets as well as the downloading end where they'll be able to access the study sets created by other users.

4. Multiplayer

The name of this feature will be **ARMS RACE**. This feature will allow the users to compete against each other in the game. This feature will make the game more complex and more competitive. The faster the user answers the question, the more points the user will receive. From time to time, some questions will come with boosts/multipliers. Whoever answers the question the fastest will get the boosts. And the user can use that boost or that multiplier whenever they want. And at the end, the user who ends with the most points will win the game. The target user is someone who studies better when with a partner, or performs better when there's something at stake. The user's primary interaction is with other users and the system gives the ability for them to interact and facilitates the competitive connection. The system

interface should allow for the interaction to take place. The value is that it helps create a better motivation system to encourage more use of the product and create more opportunities for learning.
